

ECOBULK

# ACID PROTECTOR

Extended shelf life thanks to optimum corrosion protection.

**Especially for ECOBULK with steel bottom plate, in order to prevent damage to the protective zinc layer around the outlet valve:**

- Contact with acids and alkalines reduces protection against corrosion induced by water and humidity
- Removal of residues and encrustations, e.g., of sticky filling goods, such as epoxy resins, destroys the protective layer
- The plastic component covers the endangered area and is easily replaceable when necessary
